## Supplementary Materials for "Optimality of Group Testing with Differential Misclassification" by

Yiming Li, Hong Zhang, Aiyi Liu

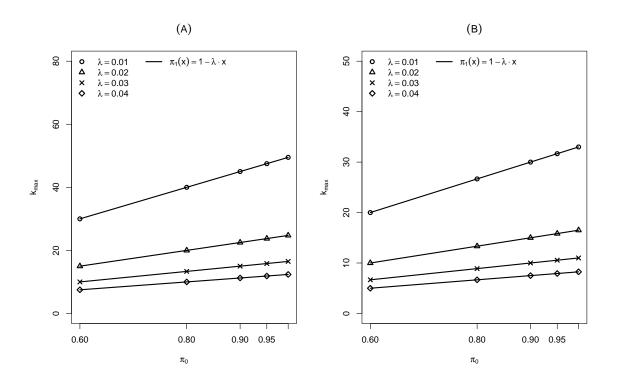

Figure S1: The maximal value  $k_{\text{max}}$  of group sizes under which the group testing (group size  $k \geq 2$ ) is more efficient than non-group testing (group size = 1). (A) The number of groups are the same for the test strategies so that the number of individuals are kn and n, respectively. (B) The total number of individuals are the same (both are kn) for the test strategies.

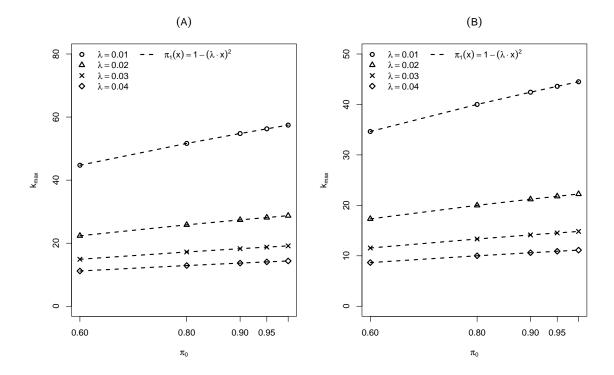

Figure S2: The maximal value  $k_{\text{max}}$  of group sizes under which the group testing (group size  $k \geq 2$ ) is more efficient than non-group testing (group size = 1). (A) The number of groups are the same for the test strategies so that the number of individuals are kn and n, respectively. (B) The total number of individuals are the same (both are kn) for the test strategies.

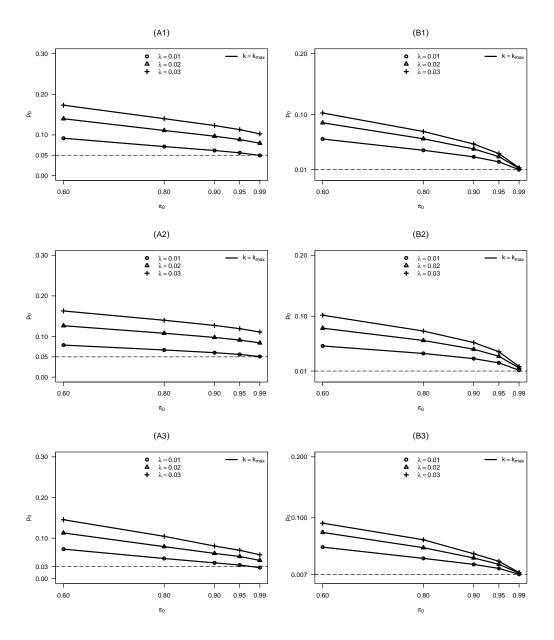

Figure S3: The values of prevalence  $p_0$  such that the variances of  $\hat{p}$  are equal for the group testing and non-group testing with  $k = k_{\text{max}}$ , where the value of  $k_{\text{max}}$  is the maximal value of group sizes satisfying Assumption 1 (column (A)) or Assumption 2 (column (B)) given in Figure S2. (A) The group testing (n groups with group size k) and non-group testing (n groups with group size k) and non-group testing (n groups with group size k) and non-group testing (n groups with group size k) and non-group testing (n groups with group size k) and non-group testing (n groups with group size k) and n and n are equal for the group sizes k and k and k and k are equal for the group sizes k and k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for the group sizes k and k are equal for

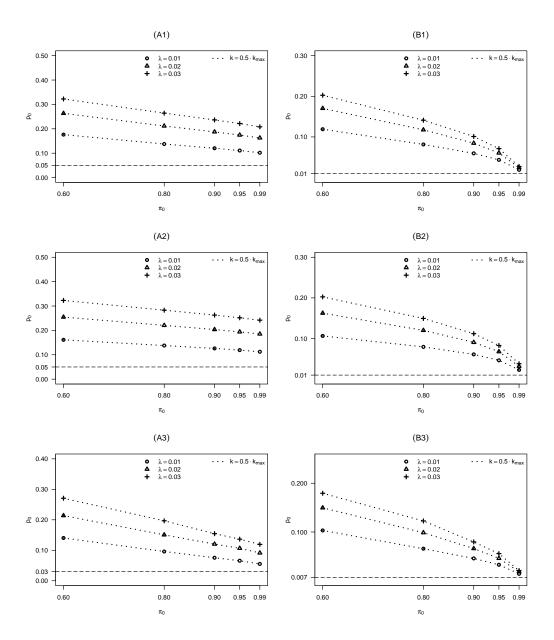

Figure S4: The values of prevalence  $p_0$  such that the variances of  $\hat{p}$  are equal for the group testing and non-group testing with  $k=0.5k_{\rm max}$ , where the value of  $k_{\rm max}$  is the maximal value of group sizes satisfying Assumption 1 (column (A)) or Assumption 2 (column (B)) given in Figure S2. (A) The group testing (n groups with group size k) and non-group testing (n groups with group size k) and non-group testing (n groups with group size k) and non-group testing (n groups with group size k) and non-group testing (n groups with group size k) and non-group testing (n groups with group size k) and n and n are equal for the group in the group is n and n and n and n are equal for the group in the group is n and n and n are equal for the group is n and n and n are equal for the group is n and n and n are equal for the group is n and n and n are equal for the group is n and n are equal for the group is n and n and n are equal for the group is n and n are equal for the group is n and n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n are equal for the group is n and n are equal for n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal for the group is n and n are equal f

We can easily derive the following corollary from Theorem 2.

Corollary S1 If Assumption 1 holds, then the group testing (n groups with a common size  $k \ge 2$ ) is more efficient than the non-group testing (n individuals) in estimating the disease prevalence p if and only if  $p < p_0$ , where  $p_0$  is the unique solution to the equation  $\sigma^2(p_0, k, n) = \sigma^2(p_0, 1, n)$ .

We can easily derive the following corollary from Theorem 4.

Corollary S2 If Assumption 2 holds, then the group testing (n groups with a common group size k) is more efficient than the non-group testing (kn individuals) in estimating the disease prevalence p if and only if  $p < p_0$ , where  $p_0$  is the unique solution to the equation  $\sigma^2(p_0, k, n) = \sigma^2(p_0, 1, nk)$ .
